Student Enrollment & Lead Analysis Dashboard

I built this project to understand how an education institute manages student leads and converts them into enrolments. The dashboard helps identify which lead sources perform best, how counsellors are performing, and where potential students drop off during the admission process.

Tools: Excel, Google Sheets, Looker Studio

Dataset: 1,200 synthetic leads (January–September 2026).

Business Questions

- How many leads convert into enrolled students?
- Which lead sources and counsellors perform best?
- How do leads and enrolments change each month?
- Which leads need follow-up?

My Approach

1. Cleaned the raw data by removing duplicates, fixing inconsistent entries, and handling missing values.
2. Used Excel formulas such as COUNTIFS, SUMIFS, and AVERAGEIFS to calculate KPIs.
3. Analysed the admission funnel, monthly trends, counsellor performance, and lead sources.
4. Created an Excel dashboard to present the findings clearly.

Key Insights

- Referral leads had the highest conversion rate at 24.2%.
- Instagram generated the most leads but had a lower conversion rate of 11.5%.
- Sneha Reddy achieved the highest counsellor conversion rate at 22.1%.
- The biggest drop-off occurred between the Interested and Applied stages.

Recommendations

- Focus more on referral campaigns to improve conversions.
- Follow up with leads who remain stuck at the Interested stage.
- Review counsellor performance and improve lead distribution.

This project helped me practice data cleaning, Excel formulas, KPI tracking, dashboard creation, and turning data into useful business insights.
